

3-DAY

July 14-16, 2009
Cleveland, OH

Advanced Machine Condition Analyst Training

DESCRIPTION

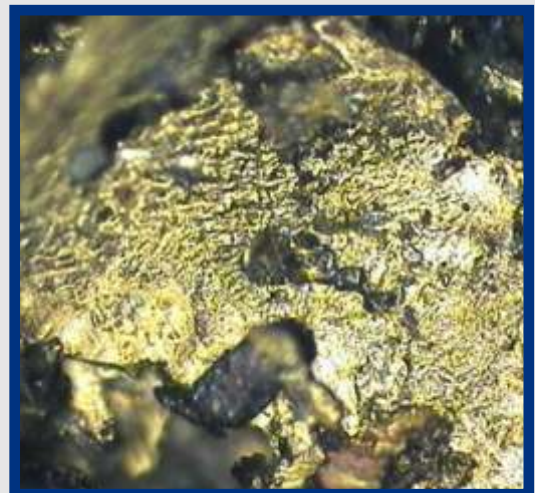

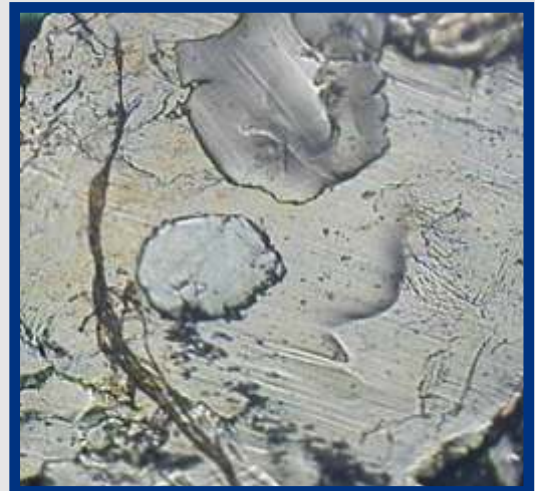

The Advanced Machine Condition Analyst training seminar is designed to provide participants with a working knowledge of ferrographic analysis and its relationship to used lubricant analysis. The knowledge enables the analyst to identify wear modes and make appropriate recommendations. Participants will learn ferrographic analysis essentials through hands-on, practical, and a personalized training program. You will perform the Ferrography process, up to 10 of your own samples, from the initial testing all the way to the final analysis. When the course is complete, you will be able to look at the ferrographic data and measure the condition of your equipment. The course will position you as the critical component in your maintenance monitoring program.

COURSE OBJECTIVES

- Learn how to effectively use an optical microscope
- Learn analytical ferrography techniques and how they apply to equipment conditions
- Perform analytical ferrography on samples and differentiate between normal and abnormal wear
- Incorporate the direct reading results with analytical ferrography and come up with a realistic visualization of the condition of the unit being tested

COURSE FOCUS

- Particle types
- Abnormal wear and wear debris
- Contamination types
- Polarized light to reveal red oxides and sand
- Heat treating abnormal wear particles
- Determine equipment condition
